

Best Potassium Source for Tomato Growers

Sure-K™ Consistently Improves Tomato Yields

Soil and/or foliar applications

North Central Research Station – Demonstration Trial, 2009

Adding Potash to Conventional nitrogen (28% UAN) and phosphorus (10-34-0) added 7.2 tons of yield. Switching to a total ACLF program added 12.7 tons of yield above the conventional fertilizer program. Applying 25% of the Sure-K, alone or with Liberate Ca, as a foliar also worked very well. However, utilizing conventional 0-0-30 as a foliar potassium didn't yield as well. **Chlorine free Sure-K fills tomatoes high demand for potassium and offers application flexibility for maximum yields and high quality tomatoes.**
