

# Pumpkins Grow Better on Liquid Diets

Soil and/or foliar applications

North Central Research Station – 2007-2009

Want More Pumpkins per acre? Switching from Conventional fertilizers to Agro-Culture Liquid Fertilizer products can really increase yields per acre, especially if you consider using ferti-Rain foliar fertilizer. Three years of research at the North Central Research Station shows this change leads to more pumpkins per acre without reducing pumpkin size. The ACLF fertilizers can be soil applied, drip irrigation applied and some can even be applied as foliars in combination with regular pesticide applications.
