

ACLF fertilizers & Drip Irrigation

Two ways to increase Bell Pepper Yields

The Conventional fertilizer program (2) yielded one ton less than the ACLF Base program (3). In both these two treatments, 100% of the fertilizer was applied prior to planting. Dividing the same rates of fertilizer into 60% pre-season & 40% applied with drip irrigation during the growing season (treatments 4-8) enhanced bell pepper yields, especially if ACLF products like Sure-K was applied in the irrigation water (7). Contact ACLF for more details
