

Think you're done fertilizing your winter wheat after topdress is over?  
*Maybe not if you want more yield!*

Replicated plot research in 2010 at several locations showed the benefits of adding some foliar nutrition to the fungicide application. *High NRG-NR™* and *ferti-Rain™* at 3 gal/A boosted yield with no leaf injury.

What to use? Expanded tests at the NCRS found that *High NRG-NR™* worked better if *Pro-Germinator™* and *Micro 500™* were applied with the drill, and *ferti-Rain™* worked better if no fertilizer was applied at planting.  
(Full details of all tests are in the *2010 Research Report*).
