

Promoting Young Fruit Tree Growth

Grand Traverse County, MI - Third year cherry trees

The use of Fase 2, a foliar fertilizer product, promoted greater growth and development of the trees both years of application. Greater trunk diameter, taller trees and more lateral branching were observed each year in this orchard. **This development should allow these trees to become productive sooner and/or result in greater yields for the initial harvests.**

Check = Full fertility program applied to the soil only, but no foliar fertilizer applications.

Fase 2 = Full fertility program applied to the soil and Fase 2 applied monthly at 2 qt/Acre. First application after initial leaf development.
