

Sweetcorn – Foliar options to enhance yields

- ❑ Foliar fertilizer applications (2 quarts /Acre) during early sweet corn development (V5 to V6) can enhance marketable sweet corn yields. This early timing is when the corn plant is determining row number on the cob.
- ❑ Foliar applied Sure-K as well as Woody Plants & Trees, both applied at 2 quarts per acre, improved marketable yields by over 3 tons per acre. Match the product to your soil test. Low potassium soils as with this trial benefit most from Sure-K. Woody Plants & Trees may be best with low phosphorus soils.
- ❑ Not all foliars are the same, conventional 20-20-20 foliar added nothing to crop yields

Planter applied 2x2, High-NRG-N@16, Pro-Germinator@4, Sure-K @8.5, Micro 500@ 2qt. and Side-dress eNhance and 28% UAN @30 GPA
