

# Watermelon Yields

Higher yielding with ACLF Products

Nutr.	#/Acre
Nitrogen	155
P2O5	50
K2O	150

The AgroLiquid program in this trial at NCRS began with soil applications prior to planting. Additional fertility was applied with the setter water at transplant and several foliar applications on designated treatments. The AgroLiquid was shown to enhance yields, in particular early yields with fertiRain foliar, which would lead to higher revenue from early sales. The AgroLiquid programs showed relatively even yields over the four harvests but yields were not as high early yields as when foliar applications of fertiRain were utilized. (For complete trial details see 2013 AgroLiquid Research Report)
